[0001] This application is a continuation of Application No. 09/563,143, filed May 2, 2000, how abandoned.

Field of the Invention

[0002] The present invention relates to matrices comprising sulfonated aryl sulfonate polymers and methods for preparing them. In particular, the invention relates to the use of a sulfonating solvent to make a sulfonated aryl sulfonate polymer solution, which is then cast as a wet film from which the matrix is coagulated.

Background of the Invention

[0003] Polymeric matrices, including porous matrices and membrane matrices, are well known in the art. Membrane matrices are used in a variety of filtration applications, such as purification and testing in the food and beverage industry, water treatment, pharmaceuticals, and in medical laboratories. Porous matrices have become increasingly relevant to the testing industry for uses including medical diagnostics, e.g., glucose monitoring test strips.

[0004] Most polymeric matrices are generally made by first preparing a casting solution made up of the chosen polymer in a suitable solvent. The casting dope is then formed into a thin sheet and the polymer is precipitated or coagulated into a solid phase. Precipitating or coagulating the polymer into a solid porous matrix or membrane matrix is normally carried out by evaporating the solvent or contacting the polymer with a non-solvent liquid in a coagulation bath. By varying the composition of the polymer or casting solution, or the process conditions, matrices having varying morphology, porosity, and performance characteristics are produced.

[0005] In producing the matrices of the present invention, various technologies come into play. These include the dissolution of polymers in sulfonating solvents, the use of sulfonated polymers to make matrices, and the use of acid-type solvents for making matrices.
